If the axiom of choice holds, then every cardinal $\hat{\iota}^0$ has a successor $\hat{\iota}^0 + > \hat{\iota}^0$, and there are no cardinals between $\hat{\iota}^0$ and its successor. (Without the axiom of choice, using Hartogs' theorem, it can be shown that, for any cardinal number $\hat{\iota}^0$, there is a minimal cardinal $\hat{\iota}^0 +$, such that $+ \hat{\iota}^0 \leq \hat{\iota}^0$.) For finite cardinals, the successor is simply $\hat{\iota}^0 + 1$.

Transfinite numbers are numbers that are "infinite" in the sense that they are larger than all finite numbers, yet not necessarily absolutely infinite. The term transfinite was coined by Georg Cantor, who wished to avoid some of the implications of the word infinite in connection with these objects, which were, nevertheless, not finite. Few contemporary writers share these qualms; it is now ...

This note introduces topology, covering topics fundamental to modern analysis and geometry. It also deals with subjects like topological spaces and continuous functions, connectedness, compactness, separation axioms, and selected further topics such as function spaces, metrization theorems, embedding theorems and the fundamental group.
