IEEE Xplore Abstract - Faults Affecting the Optical DWDM

Study on system fault detectability, isolability and identifiability plays a central role in the structural analysis for the construction of a technical process and for the design of an FDI system. In this chapter, we shall introduce the concepts of system fault detectability, isolability and identifiability, study their checking criteria and illustrate the major results using the application examples.

On the other hand, performance-based definitions involve indexes of performance of fault detection algorithms. In particular, since many fault detection algorithms involve a residual generation mechanism, such definitions may capture, among other performance indexes, the signature of the fault on the residuals.

Dense wavelength digital multiplexing (DWDM) is an optical networking technology that enables vast amounts of data to be transmitted at the speed of light.

Fault detectability in DWDM : toward higher signal quality

Fault detection, isolation, and recovery (FDIR) is a subfield of control engineering which concerns itself with monitoring a system, identifying when a fault has occurred, and pinpointing the type of fault and its location. Two approaches can be distinguished: A direct pattern recognition of sensor readings that indicate a fault and an analysis of the discrepancy between the sensor readings and expected values, derived from some model.

A fault is (strongly) detectable if it is possible to construct a residual generator that is sensitive to the (constant) fault while decoupling all disturbances. Existing fault detectability criterions are reviewed and in two cases, improved versions are derived.
