I'm a keen amateur astronomer and member of a local club. I know basically what Optical Interferometry is (combining the signal of two or more telescopes to synthesize a larger scope) but can't find any technical details on how it is achieved.

Grote Reber, having failed to get hired in the team of Jansky, built a radio telescope at his own expense to explore space in the radio field, as an amateur. After World War II, research began on a larger scale with recycled military equipment (radars).

amateur and small telescope web sites, e.g., wavelab.homestead.com, suggests that up to twenty sources are regularly detected by small interferometers. Consider a circular object with uniform brightness.

## **NI : The New Mexico Tech and NRAO Instructional 2**

In optical astronomy, interferometry is used to combine signals from two or more telescopes to obtain measurements with higher resolution than could be obtained with either telescopes individually. This technique is the basis for astronomical interferometer arrays, which can make measurements of very small astronomical objects if the telescopes are spread out over a wide area.

3 5 Optical vs. Radio Interferometry Radio interferometry functions in a fundamentally different way from

optical interferometry. Radio Telescope arrays are heterodyne, meaning incoming radiation is interfered with a local oscillator signal before detection.
