As you can see the solution to the system is the coordinates of the point where the two lines intersect. So, when solving linear systems with two variables we are really asking where the two lines will intersect.

In this section we solve linear first order differential equations, i.e. differential equations in the form $y' + p(t)y = g(t)$. We give an in depth overview of the process used to solve this type of differential equation as well as a derivation of the formula needed for the integrating factor used in the solution process.

In mathematics, division by zero is division where the divisor (denominator) is zero. Such a division can be formally expressed as $a / 0$ where a is the dividend (numerator). In ordinary arithmetic, the expression has no meaning, as there is no number which, when multiplied by 0, gives a (assuming $a \neq 0$), and so division by zero is undefined. Since any number multiplied by zero is zero, the ...

Linear Programming Linear programming is often a favorite topic for both professors and students. The ability to introduce LP using a graphical approach, the relative ease of the solution method, the widespread availability of LP software packages, and the wide range of applications make LP accessible even to students with relatively weak mathematical backgrounds.

A month ago I wrote a post on First Day Lessons.. Many " more than two " of you expressed interest in the lesson "Patterns Poster" for Algebra 1. I would never redo a lesson if I didn't think it was worthwhile, and I think this is the 7th year that I do this same lesson to start off algebra.

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.
