Polyamines are organic cations found in all eukaryotic cells and intimately involved in, and required for, distinct biological functions. An increasing body of evidence indicates that the regulation of cellular polyamines is a central convergence point for the multiple signaling pathways driving various cellular functions.

Gail S. Prins, Mark Lindgren, in Knobil and Neill's Physiology of Reproduction (Fourth Edition), 2015 Spermine. Polyamines are basic, positively charged, small organic molecules. They are found in all eukaryotic cells and are believed to be involved in a variety of physiologic processes including cell proliferation.
