Carbon (from Latin: carbo "coal") is a chemical element with symbol C and atomic number 6. It is nonmetallic and tetravalent—making four electrons available to form covalent chemical bonds. It belongs to group 14 of the periodic table. Three isotopes occur naturally, <sup>12</sup>C and <sup>13</sup>C being stable, while <sup>14</sup>C is a radionuclide, decaying with a half-life of about 5,730 years.

### **Carbon - Wikipedia**

The electron is a subatomic particle, symbol  $e^-$  or  $\beta^-$ , whose electric charge is negative one elementary charge. Electrons belong to the first generation of the lepton particle family, and are generally thought to be elementary particles because they have no known components or substructure. The electron has a mass that is approximately 1/1836 that of the proton.

### **Electron - Wikipedia**

Build an atom out of protons, neutrons, and electrons, and see how the element, charge, and mass change. Then play a game to test your ideas!

1.2 The peptide bond and primary structure of proteins. The primary structure of a protein is defined as the sequence of amino acids of which it is composed. This sequence ultimately determines the shape that the protein adopts, according to the spatial limitations on the arrangement of the atoms in the protein, the chemical properties of the component amino acid residues, and the protein's ...

Labs. In the "Electrons in Atoms" lab students use a dart to determine where electrons will fall outside the nucleus. Students can use Excel to graph their results or the teacher can copy and paste the "Generic Graph" found in my Management Tips section on the Chemistry home page into the student copy of the lab report. Here is an example one of my student groups did .
